

Project Overview

Introduction

Imagine you're a mobile app developer at UVW Code Labs, tasked with creating a cutting-edge application from scratch.

Your mandate is to develop a robust and user-friendly app using **Flutter** or **React Native**, depending on the framework that best aligns with your expertise or interests.

This project is designed to apply the concepts and skills you've acquired in any of the following programs:

- **IBM iOS and Android Mobile App Developer Professional Certificate**
- **Developing Mobile Apps with Flutter Specialization**
- **Developing Mobile Apps with React Native Specialization**

Each module has one or more required labs that will help you build a mobile application from scratch. Additionally, each module includes optional labs for Flutter and React Native. If you choose to build a Flutter app for your final project, you can complete the Flutter-based optional labs in each module. Similarly, if you plan to create a React Native-based app for your final project, opt for the React Native-based optional labs.

The required labs serve as a deliverable contributing to the final project. The optional labs serve as examples to guide you in completing each required lab correctly.

Project objective

This project aims to develop a mobile app that adheres to industry best practices for user experience, performance, and functionality. Whether you choose to take inspiration from the Habit Tracker app or design an entirely new app, your work will involve implementing UI/UX, data persistence, API integration, notification systems, and preparing the app for publishing.

Scope of the project

You will deliver the following features in the app you build:

- **User authentication:** Allow users to log in and register with proper validation.
- **Home and detail screens:** Build intuitive screens for displaying and interacting with core app data.
- **Data persistence and API integration:** Store user data locally and fetch or send data via APIs.
- **Settings and notifications:** Provide configurable options for users and integrate notifications.
- **Publishing and marketing:** Prepare the app for submission to the Google Play Store or Apple App Store, including creating a marketplace listing.

Modules and tasks overview

- Module 1: User Stories and UI/UX**
 - Develop user stories in the `readme.md` file to manage your project tasks
 - Create wireframes using Figma to visualize your app's UI/UX
- Module 2: Implement Home and Detail Screens**
 - Build login, registration, home, and detail screens using Flutter or React Native
 - Ensure proper navigation between screens with a seamless user experience
- Module 3: Data Persistence and APIs**
 - Integrate data persistence mechanisms such as SQLite, SharedPreferences, or AsyncStorage
 - Connect external APIs to fetch dynamic data for your app
- Module 4: Setting Screens**
 - Implement a settings menu and detailed screens to allow user personalization
 - Add notification functionality for engaging and alerting users effectively
- Module 5: Notifications, Publishing, and Marketing**
 - Complete the steps necessary to publish your app, including signing and packaging it
 - Draft a professional marketplace listing to showcase your app's features and benefits
- Module 6: Submission and Evaluation**
 - Submit your final app for peer review. Your peers will evaluate your app based on its functionality, UI/UX, and performance

Tools and technologies

- **Flutter or React Native:** Choose the framework that best aligns with your expertise or interest.
- **Figma:** Design your wireframes and app layout.
- **GitHub:** Use version control to manage your project files and track progress.
- **IDE:** E.g., Cloud IDE, Android Studio, or Xcode to develop code and test your app's functionality.

Evaluation criteria

The capstone project is divided into modules, each containing specific deliverables. Your peers will evaluate your project based on the following key aspects:

- Adherence to user stories and design guidelines
- Quality of implementation for each feature
- Creativity and problem-solving in-app functionality
- Completeness and clarity of navigation between screen
